Cryptographic and Security Implementation

Assignment 01

02-08-2023

1 Some C proficiency tests

1. Describe the way the following C expressions would be evaluated

```
1. (signal_is_green & everything_else_OK != 0)
2. result = max<<4 + low
```

2. What is the output of the following code snippet

```
#define FOR_LOOP(n) for(i=0; i<(n); i++);
int i;

FOR_LOOP(3)
{
    puts("Inside for loop\n");
}
```

3. What does the following function do?

```
unsigned int foo(unsigned int x)
{
    unsigned int f;
    for (f = 0; x; x >>= 1)
    {
        f += x & 1;
    }
    return f;
}
```

4. What does the following function do?

```
unsigned char foo(int x, int y)
{
    unsigned char f;
    f = ((x ^ y) < 0);
    return f;
}
```

5. What does the following function do?

```
int foo(int x, int y)
{
    int f;
    r = y ^ ((x ^ y) & -(x < y));;
    return f;
}
```

6. Are these functions equivalent? Which will run faster? Assume no compiler optimization.

```
void twiddle1(int*xp,int*yp)
{
   *xp+ = *yp;
   *xp+ = *yp;
}

void twiddle2(int* xp,int* yp)
{
    *xp+=2**yp;
}
```

7. Are these functions equivalent? Which will run faster? Assume no compiler optimization.

```
void psum1(float a[],float p[],long int n)
{
    long int i;
    p[0]=a[0];
    for(i=1;i<n;i++)
    {
        p[i]=p[i-1]+a[i];
    }
}
void psum2(float a[],float p[],long int n)
{
        long int i;
        p[0]=a[0];
        for(i=1;i<n-1;i+=2)
        {
            float mid_val=p[i-1]+a[i];
            p[i]=mid_val;
            p[i+1]=mid_val+a[i+1];
```

```
          }
          if(i<n)
             p[i]=p[i-1]+a[i];
   }
```

2 Implementing AES-128 encryption function

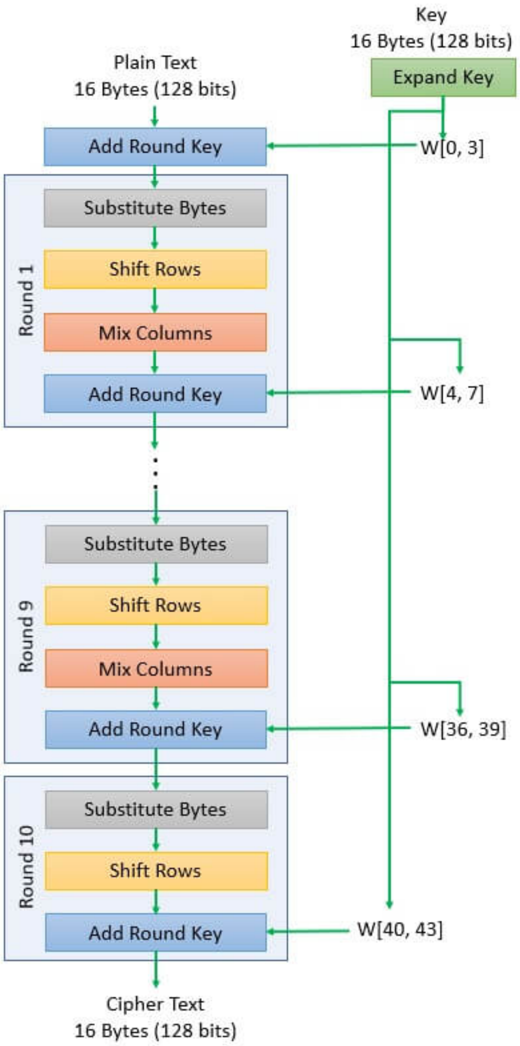
Use *unsigned char state[16]* to represent the state of AES. At the very top level, your implementation should look like this

```
   computeAES128(unsigned char *state, unsigned char *secretKey)
   {
      expandKey(unsigned char *secretKey, unsigned char *expandedKey);
      addRoundKey(state, getRoundKey(unsigned char *expandedKey, 0));
      for (i = 1; i < 10; i++)
      {
         NORMAL_AES_ROUND(unsigned char *state, getRoundKey(unsigned
             char *expandedKey, i));
      }
      FINAL_AES_ROUND(state, getRoundKey(unsigned char *expandedKey,
          10));
}
```

Additionally, you will need to implement the following functions and macros

```
// For Encryption
#define NORMAL_AES_ROUND ....
#define FINAL_AES_ROUND

void expandKey(unsigned char *secretKey, unsigned char *expandedKey);
void getRoundKey(unsigned char *expandedKey, unsigned int roundNumber);
void subBytes(unsigned char *state);
void shiftRows(unsigned char *state);
void addRoundKey(unsigned char *state, unsigned char *roundKey);
void mixColumns(unsigned char *state);
```



3 Implementing AES-128 decryption function

Use a similar program structure to implement AES-128 inverse function.

4 Testing your implementation

You will find golden test vectors for AES implementations at NIST's CAVP project site.

5 Further directions

1. Implementing CBC and CTR mode of encryption.
2. Testing your code for memory leaks; use *valgrind*
3. Getting performance benchmarks; use *gprog-ng* or *perftools*. For more fine-grained analysis, use *cachegrind*, assuming you are sticking to LUT implementation for S-Boxes.
4. Always use **openssl rand** to generate random data

6 Resources

6.1 S-Box

```
      unsigned char sbox[256] = {
